Grammar

Morphology

The language is polysynthetic and mostly agglutinative. Verbs are the morphological center of the clause, capable of incorporating a vast array of affixes including polypersonal agreement markers, tense, aspect, mood, evidentiality, and incorporated noun roots. The morphological technique is primarily agglutinative, with morphemes having clear boundaries and meanings, though some fusional patterns exist, particularly in the pronominal affix system.

Verbal Morphology

Verbs are constructed around a root, following a template. A typical finite verb complex can be a complete sentence. The affix order is strictly: **(NEG) - Evidential - Tense/Aspect - Verb Root - (Noun Incorporation / Overt Mood) - Agent Agreement - Patient Agreement**. The Noun Incorporation slot and the overt Mood slot are mutually exclusive.

Many verbal prefixes (such as evidential and tense/aspect markers) are inherently accented. When attached to a verb, they retain their accent, and any lexical accent on the verb root is deleted. This results in polysynthetic words that can have multiple accented syllables, overriding the "one accent per word" rule that applies to simpler lexical items. If a verb complex contains no inherently accented morphemes (e.g., it is composed only of `à-`, `gà-`, and an unaccented root), a default accent is placed on the verb root. For example, the verb `à-ga-gudá-sa` ("EVID.NEUT-IPFV-walk-1SG.INTR", "I am/was walking") shows the default accent on the root `gudá` because neither `à-` nor `gà-` are inherently accented.

"Translate the English sentences based on the language specifications"

Example 2

Where is my book?

gìna a-ga-ná-mi dàŋa-i pʰrìnt-lì?

where EVID.NEUT-IPFV-be_located-3SG.INTR 1SG.PRON-GEN book-INTR

NEW WORDS:

ná- — to be located (stative intransitive verb stem) | dàŋa — I/me (1st person singular independent pronoun)

NEW GRAMMAR RULES:

Locational and existential 'to be' is expressed with the stative intransitive verb stem `ná-`. Like other stative verbs, it requires an overt subject in main clauses when the subject is 3rd person.

The language lacks a copula. A dedicated stative verb for location/existence is a common linguistic feature and fits the verb-centric nature of the grammar. This rule follows the established pro-drop constraint for 3rd person intransitive subjects, which requires an overt subject (e.g., 'àta-lì' or a full NP) in main clauses, making it consistent with existing syntactic patterns.

Independent personal pronouns exist for use in non-affixal contexts (e.g., as possessors, standalone answers). The 1st person singular pronoun is `dàŋa`.

The grammar specifies pronominal affixes but not independent pronouns, which are necessary for constructions like the genitive noun phrase ('my book'). The form `dàŋa` is phonologically valid and is created to be distinct from the 1SG verbal affixes ('-da', '-sa', '-gu').

Example 3

She will give him water.

a-pi-dzanta-um-ŋa áta-nɯ gli-ka áta-wa.

EVID.NEUT-FUT-give-3SG.AGT-3SG.PAT she-AGT water-PAT him-DAT

NEW GRAMMAR RULES:

Future Tense Prefix `pi-`: A future tense is marked by the inherently accented prefix `pì-`, which occupies the Tense/Aspect slot in the verbal template.

The grammar specifies perfective ('ná-') and imperfective ('ga-') aspect prefixes but lacks a future tense marker, which is necessary for the translation. Creating `pì-` as an inherently accented prefix is consistent with the existing pattern where the perfective marker `ná-` is also accented, while the imperfective `ga-` is not, showing that tense/aspect prefixes can be either. The phonological form /pi/ is valid.

Word Order with Dative Objects: In a ditransitive clause with overt noun phrases, the dative object follows the patientive object, resulting in a V-A-P-IO (Verb-Agent-Patient-Indirect Object) order.

The grammar specifies a VSO (Verb-Agent-Patient) order for transitive clauses. A common and typologically plausible extension for ditransitive verbs is to place the additional object (the dative recipient) after the core patient object. This maintains the verb-initial structure and provides a consistent ordering for arguments.
